Introducing Today's Project!

We used Amazon lex to create a chatbot which helped the user check their account balance under three account categories after verifying their Date of Birth

What is Amazon Lex?

Amazon Lex is an AWS service that allows developers to build conversational interfaces for applications using voice and text

One thing I didn't expect in this project was...

With the Vast knowledge of AWS, there is always something that baffles me, in this case it was the inclusion of verification tools that are present on the level of users

This project took me...

This project hardly took me 15 minutes to get over with

Slots

Slots are pieces of information that a chatbot needs to complete a user's request. Think of them as blanks that need to be filled in a form.

By adding custom slots in utterances, my chatbot's users can actually chat with the bot and get useful information rather than the bot giving out generic replies

In this project, I created a custom slot type to add bank account types

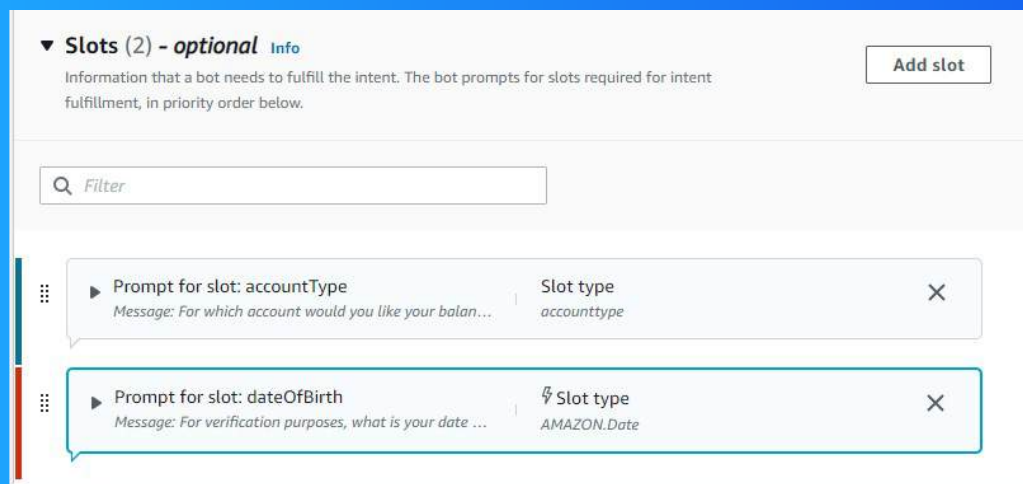

The screenshot shows the AWS Lex console interface. On the left, there's a sidebar with navigation options: 'Lex', 'Slots', and 'Create bot'. The main area is titled 'Add language to bot' with a 'help' link. Below the title, there's a dropdown menu for 'Language: English (US)'. The form contains several fields: 'Select language' (a dropdown menu), 'Description - optional' (a text area), 'Voice interaction' (a dropdown menu), 'Voice example' (a text input with a 'Play' button), and 'Intent classification confidence score threshold' (a text input). At the bottom, there are three buttons: 'Cancel', 'Add another language', and 'Save'.

Connecting slots with intents

This slot type has restricted slot values, which means makes sure that only the values that you specify will count as a valid account Type!

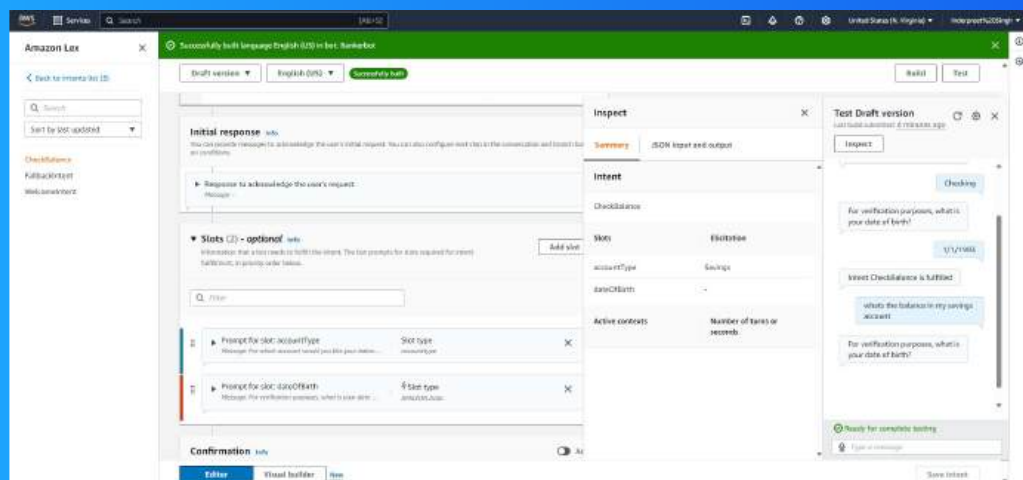

I associated my custom slot with CheckBalance, which displays the users account balances after appropriate verification i.e Date of Birth

Slot values in utterances

I included slot values in some of the utterances by adding the most commonly used openings For example can I check my account balance
